Introduction to Arduino

In the world of Arduino, Digital signals are used for everything with the exception of Analog Input Depending on the voltage of the Arduino the ON or HIGH of the Digital signal will be equal to the system voltage, while the OFF or LOW signal will always equal 0V This is a fancy way of saying that on a 5V Arduino the HIGH

SENSORS MEASUREMENTS AND INSTRUMENTATION LAB

5) Arduino software Circuit diagram: Circuit connection of GY-65 with Arduino Theory: The BMP085 is a basic sensor that is designed specifically for measuring barometric pressure (it also does temperature measurement on the side to help) It's one of the few sensors that does this measurement, and its fairly low cost so you'll see it used a lot
